

1 **ABSTRACT**

2 Methods and systems for enabling users to register for notifications
3 pertaining to electronic presentations of interest are described. The inventive
4 methods and systems enable users to monitor many different electronic
5 presentations without physically connecting to them for continuous play. Users
6 can opt to monitor for the occurrence of an electronic presentation itself, or for
7 events that might occur within various electronic presentations. The events can be
8 monitored live through the use of meta information that is generated as the
9 electronic broadcast is about to be, or is being broadcast. The meta information
10 can be generated manually or automatically.
